1 Testing for linear versus constant model

2 More Linear Algebra

Testing for the Linear Effect

- Just as a remainder from yesterday let us look at the hypotheses:

$$H_0 : \mathbb{E} Y_i = \beta_1 \quad \text{versus} \quad H_1 : \mathbb{E} Y_i = \beta_1 + \beta_2 x_i.$$

- In this example we have

$$X_0 = \begin{pmatrix} 1 \\ \dots \\ 1 \end{pmatrix} = \mathbf{1}, \quad X = \begin{pmatrix} 1 & x_1 \\ \dots & \dots \\ 1 & x_n \end{pmatrix}.$$

- Furthermore the matrix A is given by

$$A = \begin{pmatrix} 0 & 1 \end{pmatrix}.$$

- We then arrive at

$$P_0 = X_0(X_0^T X_0)^{-1} X_0^T = \frac{1}{n} \mathbf{1} \mathbf{1}^T.$$

Testing for the Linear Effect II

- We also find

$$\text{RSS} = \sum_{i=1}^n \left\{ Y_i - \bar{Y} + \frac{s_{xy}}{s_{xx}} \bar{x} - \frac{s_{xy}}{s_{xx}} x_i \right\}^2 \quad (1)$$

$$\text{RSS}_0 = \sum_{i=1}^n \{ Y_i - \bar{Y} \}^2 \quad (2)$$

- We then compute

$$F = \frac{n-2}{n-1} \frac{\text{RSS}_0 - \text{RSS}}{\text{RSS}},$$

and compare it to the quantiles of the F -distribution on 1 and $n-2$ degrees of freedom. This can be summarized in a table.

Some more linear algebra

If Q is an $n \times p$ real matrix, we define the **column space (or range)** of Q to be the set spanned by its columns:

$$\mathcal{M}(Q) = \{y \in \mathbb{R}^n : \exists \beta \in \mathbb{R}^p, y = Q\beta\}.$$

- Recall that $\mathcal{M}(Q)$ is a subspace of \mathbb{R}^n .
- The columns of Q provide a coordinate system for the subspace $\mathcal{M}(Q)$
- If Q is of full column rank (p), then the coordinates β corresponding to a $y \in \mathcal{M}(Q)$ are unique.
- Allows interpretation of system of linear equations

$$Q\beta = y.$$

[existence of solution \leftrightarrow is y an element of $\mathcal{M}(Q)$?]
[uniqueness of solution \leftrightarrow is there a unique coordinate vector β ?]

Some more linear algebra

Two further important subspaces associated with a real $n \times p$ matrix Q :

- the **null space (or kernel)**, $\ker(Q)$, of Q is the subspace defined as

$$\ker(Q) = \{x \in \mathbb{R}^p : Qx = 0\};$$

- the **orthogonal complement** of $\mathcal{M}(Q)$, $\mathcal{M}^\perp(Q)$, is the subspace defined as

$$\begin{aligned}\mathcal{M}^\perp(Q) &= \{y \in \mathbb{R}^n : y^\top Qx = 0, \forall x \in \mathbb{R}^p\} \\ &= \{y \in \mathbb{R}^n : y^\top v = 0, \forall v \in \mathcal{M}(Q)\}.\end{aligned}$$

The orthogonal complement may be defined for arbitrary subspaces by using the second equality.

Some more linear algebra

Theorem (Spectral Theorem)

A $p \times p$ matrix Q is symmetric if and only if there exists a $p \times p$ orthogonal matrix U and a diagonal matrix Λ such that

$$Q = U\Lambda U^\top.$$

In particular:

- ① *the columns of $U = (u_1 \cdots u_p)$ are eigenvectors of Q , i.e. there exist λ_j such that*

$$Qu_j = \lambda_j u_j, \quad j = 1, \dots, p;$$

- ② *the entries of $\Lambda = \text{diag}(\lambda_1, \dots, \lambda_p)$ are the corresponding eigenvalues of Q , which are real; and*
- ③ *the rank of Q is the number of non-zero eigenvalues.*

Note: if the eigenvalues are distinct, the eigenvectors are unique (up to changes in signs).

Some more linear algebra

Theorem (Singular Value Decomposition)

Any $n \times p$ real matrix can be factorised as

$$Q = \underset{n \times p}{U} \underset{n \times n}{\Sigma} \underset{p \times p}{V}^{\top},$$

where U and V^{\top} are orthogonal with columns called left singular vectors and right singular vectors, respectively, and Σ is diagonal with real entries called singular values.

- ① The left singular vectors are eigenvectors of QQ^{\top} .
- ② The right singular vectors are eigenvectors of $Q^{\top}Q$.
- ③ The squares of the singular values are eigenvalues of both QQ^{\top} and $Q^{\top}Q$.
- ④ The left singular vectors corresponding to non-zero singular values form an orthonormal basis for $\mathcal{M}(Q)$.
- ⑤ The left singular vectors corresponding to zero singular values form an orthonormal basis for $\mathcal{M}^{\perp}(Q)$.

Some more linear algebra

A matrix Q is called **idempotent** if $Q^2 = Q$.

An **orthogonal projection** (henceforth **projection**) onto a subspace \mathcal{V} is a symmetric idempotent matrix H such that $\mathcal{M}(H) = \mathcal{V}$.

Proposition

The only possible eigenvalues of a projection matrix are 0 and 1.

Proposition

Let \mathcal{V} be a subspace and H be a projection onto \mathcal{V} . Then $I - H$ is the projection matrix onto \mathcal{V}^\perp .

Proof (*).

$(I - H)^\top = I - H^\top = I - H$ since H is symmetric and,
 $(I - H)^2 = I^2 - 2H + H^2 = I - H$. Thus $I - H$ is a projection matrix.

It remains to identify the column space of $I - H$. Let $H = U\Lambda U^\top$ be the spectral decomposition of H . Then $I - H = UU^\top - U\Lambda U^\top = U(I - \Lambda)U^\top$. Hence the column space of $I - H$ is spanned by the eigenvectors of H corresponding to zero eigenvalues of H , which coincides with $\mathcal{M}^\perp(H) = \mathcal{V}^\perp$. \square

Some more linear algebra

Proposition

Let \mathcal{V} be a subspace and H be a projection onto \mathcal{V} . Then $H\mathbf{y} = \mathbf{y}$ for all $\mathbf{y} \in \mathcal{V}$.

Proposition

If P and Q are projection matrices onto a subspace \mathcal{V} , then $P = Q$.

Proposition

If $\mathbf{x}_1, \dots, \mathbf{x}_p$ are linearly independent and are such that $\text{span}(\mathbf{x}_1, \dots, \mathbf{x}_p) = \mathcal{V}$, then the projection onto \mathcal{V} can be represented as

$$H = X(X^\top X)^{-1}X^\top$$

where X is a matrix with columns $\mathbf{x}_1, \dots, \mathbf{x}_p$.

Some more linear algebra

Proposition

Let \mathcal{V} be a subspace of \mathbb{R}^n and H be a projection onto \mathcal{V} . Then

$$\|x - Hx\| \leq \|x - v\|, \quad \forall v \in \mathcal{V}.$$

Proof (*).

Let $H = U\Lambda U^\top$ be the spectral decomposition of H , $U = (u_1 \cdots u_n)$ and $\Lambda = \text{diag}(\lambda_1, \dots, \lambda_n)$. Letting $p = \dim(\mathcal{V})$,

- ① $\lambda_1 = \dots = \lambda_p = 1$ and $\lambda_{p+1} = \dots = \lambda_n = 0$,
- ② u_1, \dots, u_n is an orthonormal basis of \mathbb{R}^n ,
- ③ u_1, \dots, u_p is an an orthonormal basis of \mathcal{V} .

Some more linear algebra

$$\begin{aligned}
\|x - Hx\|^2 &= \sum_{i=1}^n (x^\top u_i - (Hx)^\top u_i)^2 && [\text{orthonormal basis}] \\
&= \sum_{i=1}^n (x^\top u_i - x^\top H u_i)^2 && [H \text{ is symmetric}] \\
&= \sum_{i=1}^n (x^\top u_i - \lambda_i x^\top u_i)^2 && [u\text{'s are eigenvectors of } H] \\
&= 0 + \sum_{i=p+1}^n (x^\top u_i)^2 && [\text{eigenvalues 0 or 1}] \\
&\leq \sum_{i=1}^p (x^\top u_i - v^\top u_i)^2 + \sum_{i=p+1}^n (x^\top u_i)^2 && \forall v \in \mathcal{V} \\
&= \|x - v\|^2.
\end{aligned}$$

□

Some more linear algebra

Proposition

Let $\mathcal{V}_1 \subseteq \mathcal{V} \subseteq \mathbb{R}^n$ be two nested linear subspaces. If H_1 is the projection onto \mathcal{V}_1 and H is the projection onto \mathcal{V} , then

$$HH_1 = H_1 = H_1H.$$

Proof (*).

First we show that $HH_1 = H_1$, and then that $H_1H = HH_1$. For all $y \in \mathbb{R}^n$ we have $H_1y \in \mathcal{V}_1$. But then $H_1y \in \mathcal{V}$, since $\mathcal{V}_1 \subseteq \mathcal{V}$.

Therefore $HH_1y = H_1y$. We have shown that $(HH_1 - H_1)y = 0$ for all $y \in \mathbb{R}^n$, so that $HH_1 - H_1 = 0$, as its kernel is all \mathbb{R}^n . Hence $HH_1 = H_1$.

To prove that $H_1H = HH_1$, note that symmetry of projection matrices and the first part of the proof give

$$H_1H = H_1^\top H^\top = (HH_1)^\top = (H_1)^\top = H_1 = HH_1.$$

□

Some more linear algebra

Definition (Non-Negative Matrix – Quadratic Form Definition)

A $p \times p$ real symmetric matrix Ω is called non-negative definite (written $\Omega \succeq 0$) if and only if $x^\top \Omega x \geq 0$ for all $x \in \mathbb{R}^p$. If $x^\top \Omega x > 0$ for all $x \in \mathbb{R}^p \setminus \{0\}$, then we call Ω positive definite (written $\Omega \succ 0$).

Definition (Non-Negative Matrix – Spectral Definition)

A $p \times p$ real symmetric matrix Ω is called non-negative definite (written $\Omega \succeq 0$) if and only if the eigenvalues of Ω are non-negative. If the eigenvalues of Ω are strictly positive, then Ω is called positive definite (written $\Omega \succ 0$).

Lemma (Little exercise)

The two definitions are equivalent.

Proposition (Non-Negative and Covariance Matrices)

Let Ω be a real symmetric matrix. Then Ω is non-negative definite if and only if Ω is the covariance matrix of some random vector Y .

Some more linear algebra

- Let Y be a random vector in \mathbb{R}^d with covariance matrix Ω .
- Find direction $v_1 \in \mathbb{S}^{d-1}$ such that the projection of Y onto v_1 has maximal variance.
- For $j = 2, 3, \dots, d$, find direction $v_j \perp \{v_1, \dots, v_{j-1}\}$ such that projection of Y onto v_j has maximal variance.

Solution: maximise $\text{var}(v_1^\top Y) = v_1^\top \Omega v_1$ over $\|v_1\| = 1$

$$v_1^\top \Omega v_1 = v_1^\top U \Lambda U^\top v_1 = \|\Lambda^{1/2} U^\top v_1\|^2 = \sum_{i=1}^d \lambda_i (u_i^\top v_1)^2 \quad [\text{change of basis}]$$

Now $\sum_{i=1}^d (u_i^\top v_1)^2 = \|v_1\|^2 = 1$ so we have a convex combination of $\{\lambda_j\}_{j=1}^d$.

$$\sum_{i=1}^d p_i \lambda_i, \quad \sum_i p_i = 1, \quad p_i \geq 0, \quad i = 1, \dots, d.$$

But $\lambda_1 \geq \lambda_i \geq 0$ so clearly this sum is maximised when $p_1 = 1$ and $p_j = 0$ $\forall j \neq 1$, i.e. $v_1 = \pm u_1$.

Iteratively, $v_j = \pm u_j$, i.e. principal components are eigenvectors of Ω .

Some more linear algebra

Theorem (Optimal (Linear) Dimension Reduction Theorem)

Let \mathbf{Y} be a mean-zero random variable in \mathbb{R}^d with $d \times d$ covariance $\mathbf{\Omega}$. Let \mathbf{H} be the projection matrix onto the span of the first k eigenvectors of $\mathbf{\Omega}$. Then

$$\mathbb{E} \|\mathbf{Y} - \mathbf{H}\mathbf{Y}\|^2 \leq \mathbb{E} \|\mathbf{Y} - \mathbf{Q}\mathbf{Y}\|^2$$

for any $d \times d$ projection matrix \mathbf{Q} of rank at most k .

Intuitively: if you want to approximate a mean-zero random variable taking values \mathbb{R}^d by a random variable that ranges over a subspace of dimension at most $k \leq d$, the optimal choice is the projection of the random variable onto the space spanned by its first k principal components (eigenvectors of the covariance).

“Optimal” is with respect to the mean squared error.

For the proof, use lemma below (follows immediately from spectral decomposition)

Lemma

\mathbf{Q} is a rank k projection matrix if and only if there exist orthonormal vectors $\{\mathbf{v}_j\}_{j=1}^k$ such that $\mathbf{Q} = \sum_{j=1}^k \mathbf{v}_j \mathbf{v}_j^\top$.

Some more linear algebra

Proof of Optimal Linear Dimension Reduction (*).

Write $\mathbf{Q} = \sum_{j=1}^k \mathbf{v}_j \mathbf{v}_j^\top$ for some orthonormal $\{\mathbf{v}_j\}_{j=1}^k$. Then

$$\begin{aligned}
 \mathbb{E} \|\mathbf{Y} - \mathbf{QY}\|^2 &= \\
 &= \mathbb{E} \left[\mathbf{Y}^\top (\mathbf{I} - \mathbf{Q})^\top (\mathbf{I} - \mathbf{Q}) \mathbf{Y} \right] = \mathbb{E} \left[\text{tr} \{ (\mathbf{I} - \mathbf{Q}) \mathbf{Y} \mathbf{Y}^\top (\mathbf{I} - \mathbf{Q})^\top \} \right] \\
 &= \text{tr} \{ (\mathbf{I} - \mathbf{Q}) \mathbb{E} \left[\mathbf{Y} \mathbf{Y}^\top \right] (\mathbf{I} - \mathbf{Q})^\top \} = \text{tr} \{ (\mathbf{I} - \mathbf{Q})^\top (\mathbf{I} - \mathbf{Q}) \Omega \} \\
 &= \text{tr} \{ (\mathbf{I} - \mathbf{Q}) \Omega \} = \text{tr} \{ \Omega \} - \text{tr} \{ \mathbf{Q} \Omega \} = \sum_{i=1}^d \lambda_i - \text{tr} \left\{ \sum_{j=1}^k \mathbf{v}_j \mathbf{v}_j^\top \Omega \right\} \\
 &= \sum_{i=1}^d \lambda_i - \sum_{j=1}^k \text{tr} \{ \mathbf{v}_j \mathbf{v}_j^\top \Omega \} = \sum_{i=1}^d \lambda_i - \sum_{j=1}^k \mathbf{v}_j \Omega \mathbf{v}_j^\top \\
 &= \sum_{i=1}^d \lambda_i - \sum_{j=1}^k \text{var}[\mathbf{v}_j^\top \mathbf{Y}]
 \end{aligned}$$

If we can minimise this expression over all $\{\mathbf{v}_j\}_{j=1}^k$ with $\mathbf{v}_i^\top \mathbf{v}_j = \mathbf{1}\{i=j\}$, then we're done. By PCA, this is done by choosing the top k eigenvectors of Ω . \square

Some more linear algebra

Corollary (Deterministic Version)

Let $\{x_1, \dots, x_p\} \subset \mathbb{R}^d$ be such that $x_1 + \dots + x_p = 0$, and let X be the matrix with columns $\{x_i\}_{i=1}^p$. The best approximating k -hyperplane to the points $\{x_1, \dots, x_p\}$ is given by the span of the first k eigenvectors of the matrix XX^\top , i.e. if H is the projection onto this span, it holds that

$$\sum_{i=1}^p \|x_i - Hx_i\|^2 \leq \sum_{i=1}^p \|x_i - Qx_i\|^2$$

for any $d \times d$ projection operator Q of rank at most k .

Proof.

Define the discrete random vector Y by $\mathbb{P}[Y = x_i] = 1/p$, and use optimal linear dimension reduction as stated earlier. \square

Some more linear algebra

Definition (Multivariate Gaussian Distribution)

A random vector \mathbf{Y} in \mathbb{R}^d has the multivariate normal distribution if and only if $\beta^\top \mathbf{Y}$ has the univariate normal distribution, $\forall \beta \in \mathbb{R}^d$.

How can we use this definition to determine basic properties?

Recall that the *moment generating function* (MGF) of a random vector \mathbf{W} in \mathbb{R}^d is defined as

$$M_{\mathbf{W}}(\boldsymbol{\theta}) = \mathbb{E}[e^{\boldsymbol{\theta}^\top \mathbf{W}}], \quad \boldsymbol{\theta} \in \mathbb{R}^d,$$

provided the expectation exists. When the MGF exists *it characterises the distribution of the random vector*. Furthermore, two random vectors are independent if and only if their joint MGF is the product of their marginal MGF's.

Some more linear algebra

Most important facts about Gaussian vectors:

- ① Moment generating function of $Y \sim \mathcal{N}(\mu, \Omega)$:

$$M_Y(u) = \exp \left(u^\top \mu + \frac{1}{2} u^\top \Omega u \right).$$

- ② $Y \sim \mathcal{N}(\mu_{p \times 1}, \Omega_{p \times p})$ and given $B_{n \times p}$ and $\theta_{n \times 1}$, then
 $\theta + B Y \sim \mathcal{N}(\theta + B \mu, B \Omega B^\top)$.
- ③ $\mathcal{N}(\mu, \Omega)$ density, assuming Ω nonsingular:

$$f_Y(y) = \frac{1}{(2\pi)^{p/2} |\Omega|^{1/2}} \exp \left\{ -\frac{1}{2} (y - \mu)^\top \Omega^{-1} (y - \mu) \right\}.$$

- ④ Constant density isosurfaces are ellipsoidal
- ⑤ Marginals of Gaussian are Gaussian (converse NOT true).
- ⑥ Ω diagonal \Leftrightarrow independent coordinates Y_j .
- ⑦ If $Y \sim \mathcal{N}(\mu_{p \times 1}, \Omega_{p \times p})$,

Some more linear algebra

Proposition (Property 1: Moment Generating Function)

The moment generating function of $Y \sim \mathcal{N}(\mu, \Omega)$ is

$$M_Y(u) = \exp\left(u^\top \mu + \frac{1}{2} u^\top \Omega u\right)$$

Proof (*).

Let $u \in \mathbb{R}^d$ be arbitrary. Then $u^\top Y$ is Gaussian with mean $u^\top \mu$ and variance $u^\top \Omega u$. Hence it has moment generating function:

$$M_{u^\top Y}(t) = \mathbb{E}\left(e^{t u^\top Y}\right) = \exp\left\{t(u^\top \mu) + \frac{t^2}{2}(u^\top \Omega u)\right\}.$$

Now take $t = 1$ and observe that

$$M_{u^\top Y}(1) = \mathbb{E}\left(e^{u^\top Y}\right) = M_Y(u).$$

Combining the two, we conclude that

$$M_Y(u) = \exp\left(u^\top \mu + \frac{1}{2} u^\top \Omega u\right), \quad u \in \mathbb{R}^d.$$

□

Some more linear algebra

Proposition (Property 2: Affine Transformation)

For $Y \sim \mathcal{N}(\mu_{p \times 1}, \Omega_{p \times p})$ and given $B_{n \times p}$ and $\theta_{n \times 1}$, we have

$$\theta + BY \sim \mathcal{N}(\theta + B\mu, B\Omega B^\top)$$

Proof (*).

$$\begin{aligned} M_{\theta + BY}(u) &= \mathbb{E} [\exp\{u^\top(\theta + BY)\}] = \exp\{u^\top\theta\} \mathbb{E} [\exp\{(B^\top u)^\top Y\}] \\ &= \exp\{u^\top\theta\} M_Y(B^\top u) \\ &= \exp\{u^\top\theta\} \exp\left\{(B^\top u)^\top \mu + \frac{1}{2} u^\top B\Omega B^\top u\right\} \\ &= \exp\left\{u^\top\theta + u^\top(B\mu) + \frac{1}{2} u^\top B\Omega B^\top u\right\} \\ &= \exp\left\{u^\top(\theta + B\mu) + \frac{1}{2} u^\top B\Omega B^\top u\right\} \end{aligned}$$

And this last expression is the MGF of a $\mathcal{N}(\theta + B\mu, B\Omega B^\top)$ distribution. □

Some more linear algebra

Proposition (Property 3: Density Function)

Let $\Omega_{p \times p}$ be nonsingular. The density of $\mathcal{N}(\mu_{p \times 1}, \Omega_{p \times p})$ is

$$f_Y(y) = \frac{1}{(2\pi)^{p/2} |\Omega|^{1/2}} \exp \left\{ -\frac{1}{2} (y - \mu)^\top \Omega^{-1} (y - \mu) \right\}$$

Proof (*).

Let $Z = (Z_1, \dots, Z_p)^\top$ be a vector of iid $\mathcal{N}(0, 1)$ random variables. Then, because of independence,

(a) the density of Z is

$$f_Z(z) = \prod_{i=1}^p f_{Z_i}(z_i) = \prod_{i=1}^p \frac{1}{\sqrt{2\pi}} \exp \left(-\frac{1}{2} z_i^2 \right) = \frac{1}{(2\pi)^{p/2}} \exp \left(-\frac{1}{2} z^\top z \right).$$

(b) The MGF of Z is

$$M_Z(u) = \mathbb{E} \left\{ \exp \left(\sum_{i=1}^p u_i Z_i \right) \right\} = \prod_{i=1}^p \mathbb{E} \{ \exp(u_i Z_i) \} = \exp(u^\top u / 2),$$

which is the MGF of a p -variate $\mathcal{N}(0, I)$ distribution.

Some more linear algebra

$\xRightarrow{(a)+(b)}$ the $\mathcal{N}(0, I)$ density is $f_Z(z) = \frac{1}{(2\pi)^{p/2}} \exp\left(-\frac{1}{2}z^\top z\right)$.

By the spectral theorem, Ω admits a square root, $\Omega^{1/2}$. Furthermore, since Ω is non-singular, so is $\Omega^{1/2}$.

Now observe that from our Property 2, we have $Y \stackrel{d}{=} \Omega^{1/2}Z + \mu \sim \mathcal{N}(\mu, \Omega)$.

By the change of variables formula,

$$\begin{aligned} f_Y(y) &= f_{\Omega^{1/2}Z + \mu}(y) \\ &= |\Omega^{-1/2}| f_Z\{\Omega^{-1/2}(y - \mu)\} \\ &= \frac{1}{(2\pi)^{p/2} |\Omega|^{1/2}} \exp\left\{-\frac{1}{2}(y - \mu)^\top \Omega^{-1}(y - \mu)\right\}. \end{aligned}$$

[Recall that to obtain the density of $W = g(X)$ at w , we need to evaluate f_X at $g^{-1}(w)$ but also multiply by the Jacobian determinant of g^{-1} at w .]

□

Some more linear algebra

Proposition (Property 4: Isosurfaces)

The isosurfaces of a $\mathcal{N}(\boldsymbol{\mu}_{p \times 1}, \boldsymbol{\Omega}_{p \times p})$ are $(p - 1)$ -dimensional ellipsoids centred at $\boldsymbol{\mu}$, with principal axes given by the eigenvectors of $\boldsymbol{\Omega}$ and with anisotropies given by the ratios of the square roots of the corresponding eigenvalues of $\boldsymbol{\Omega}$.

Proof (*).

Exercise: Use Property 3, and the spectral theorem. □

Proposition (Property 5: Coordinate Distributions)

Let $\mathbf{Y} = (Y_1, \dots, Y_p)^\top \sim \mathcal{N}(\boldsymbol{\mu}_{p \times 1}, \boldsymbol{\Omega}_{p \times p})$. Then $Y_j \sim \mathcal{N}(\mu_j, \Omega_{jj})$.

Proof (*).

Observe that $Y_j = (0, 0, \dots, \underbrace{1}_{j\text{th position}}, \dots, 0, 0) \mathbf{Y}$ and use Property 2. □

Some more linear algebra

Proposition (Property 6: Diagonal $\Omega \iff$ Independence)

Let $\mathbf{Y} = (Y_1, \dots, Y_p)^\top \sim \mathcal{N}(\boldsymbol{\mu}_{p \times 1}, \Omega_{p \times p})$. Then the Y_i are mutually independent if and only if Ω is diagonal.

Proof (*).

Suppose that the Y_j are independent. Property 5 yields $Y_j \sim \mathcal{N}(\mu_j, \sigma_j^2)$ for some $\sigma_j > 0$. Thus the density of \mathbf{Y} is

$$\begin{aligned} f_{\mathbf{Y}}(\mathbf{y}) &= \prod_{j=1}^p f_{Y_j}(y_j) = \prod_{j=1}^p \frac{1}{\sigma_j \sqrt{2\pi}} \exp \left\{ -\frac{1}{2} \frac{(y_j - \mu_j)^2}{\sigma_j^2} \right\} \\ &= \frac{1}{(2\pi)^{p/2} |\text{diag}(\sigma_1^2, \dots, \sigma_p^2)|^{1/2}} \exp \left\{ -\frac{1}{2} (\mathbf{y} - \boldsymbol{\mu})^\top \text{diag}(\sigma_1^{-2}, \dots, \sigma_p^{-2}) (\mathbf{y} - \boldsymbol{\mu}) \right\}. \end{aligned}$$

Hence $\mathbf{Y} \sim \mathcal{N}\{\boldsymbol{\mu}, \text{diag}(\sigma_1^2, \dots, \sigma_p^2)\}$, i.e. the covariance Ω is diagonal.

Conversely, assume Ω is diagonal, say $\Omega = \text{diag}(\sigma_1^2, \dots, \sigma_p^2)$. Then we can reverse the steps of the first part to see that the joint density $f_{\mathbf{Y}}(\mathbf{y})$ can be written as a product of the marginal densities $f_{Y_j}(y_j)$, thus proving independence. □

Some more linear algebra

Proposition (Property 7: AY, BY indep $\iff A\Omega B^\top = 0$)

If $Y \sim \mathcal{N}(\mu_{p \times 1}, \Omega_{p \times p})$, and $A_{m \times p}$, $B_{d \times p}$ be real matrices. Then,

$$AY \text{ independent of } BY \iff A\Omega B^\top = 0.$$

Proof (*). [wlog assuming $\mu = 0$ (simplifies the algebra)]

First assume $A\Omega B^\top = 0$. Let $W_{(m+d) \times 1} = \begin{pmatrix} AY \\ BY \end{pmatrix}$ and $\theta_{(m+d) \times 1} = \begin{pmatrix} u_{m \times 1} \\ v_{d \times 1} \end{pmatrix}$.

$$\begin{aligned} M_W(\theta) &= \mathbb{E}[\exp\{W^\top \theta\}] = \mathbb{E}\left[\exp\left\{Y^\top A^\top u + Y^\top B^\top v\right\}\right] \\ &= \mathbb{E}\left[\exp\left\{Y^\top (A^\top u + B^\top v)\right\}\right] = M_Y(A^\top u + B^\top v) \\ &= \exp\left\{\frac{1}{2}(A^\top u + B^\top v)^\top \Omega (A^\top u + B^\top v)\right\} \\ &= \exp\left\{\frac{1}{2}\left(u^\top A\Omega A^\top u + v^\top B\Omega B^\top v + \underbrace{u^\top A\Omega B^\top}_{=0} v + v^\top \underbrace{B\Omega A^\top}_{=0} u\right)\right\} \end{aligned}$$

Some more linear algebra

For the converse, assume that $\mathbf{A}\mathbf{Y}$ and $\mathbf{B}\mathbf{Y}$ are independent. Then, $\forall \mathbf{u}, \mathbf{v}$,

$$M_{\mathbf{W}}(\boldsymbol{\theta}) = M_{\mathbf{A}\mathbf{Y}}(\mathbf{u})M_{\mathbf{B}\mathbf{Y}}(\mathbf{v}), \quad \forall \mathbf{u}, \mathbf{v},$$

$$\Rightarrow \exp \left\{ \frac{1}{2} \left(\mathbf{u}^\top \mathbf{A} \boldsymbol{\Omega} \mathbf{A}^\top \mathbf{u} + \mathbf{v}^\top \mathbf{B} \boldsymbol{\Omega} \mathbf{B}^\top \mathbf{v} + \mathbf{u}^\top \mathbf{A} \boldsymbol{\Omega} \mathbf{B}^\top \mathbf{v} + \mathbf{v}^\top \mathbf{B} \boldsymbol{\Omega} \mathbf{A}^\top \mathbf{u} \right) \right\}$$

$$= \exp \left\{ \frac{1}{2} \mathbf{u}^\top \mathbf{A} \boldsymbol{\Omega} \mathbf{A}^\top \mathbf{u} \right\} \exp \left\{ \frac{1}{2} \mathbf{v}^\top \mathbf{B} \boldsymbol{\Omega} \mathbf{B}^\top \mathbf{v} \right\}$$

$$\Rightarrow \exp \left\{ \frac{1}{2} \times 2 \mathbf{v}^\top \mathbf{A} \boldsymbol{\Omega} \mathbf{B}^\top \mathbf{u} \right\} = 1$$

$$\Rightarrow \mathbf{v}^\top \mathbf{A} \boldsymbol{\Omega} \mathbf{B}^\top \mathbf{u} = 0, \quad \forall \mathbf{u}, \mathbf{v},$$

$$\Rightarrow \mathbf{A} \boldsymbol{\Omega} \mathbf{B}^\top = 0.$$
